PEE TIMER

The Pee Timer presents an exaggerated, dystopic future workplace where the only legitimate breaks from work are those used to urinate. Made with an Intel® RealSense™ 3D Camera, an Arduino, a water pump, a Power Switch Tail II, two vases, and some colored water, this device detects when the user is away from their workspace and works to shame through public tweets about their use of time and by “peeing” into a clear vase on their desks, which the user must clean up when they return or risk ruining their work area.
